

Coming from the pioneers of computer silencing: MagicFleece - the superior alternative to foam.

MagicFleece

The allround talent

MagicFleece is a two-layered sound absorbing fleece. It is composed of countless polyester microfibrers that are woven into a smooth compound using advanced fibre processing technology. The open structure of MagicFleece lets the noise penetrate deeply into the material, where it is absorbed efficiently due to the enormous surface area inside the fleece.

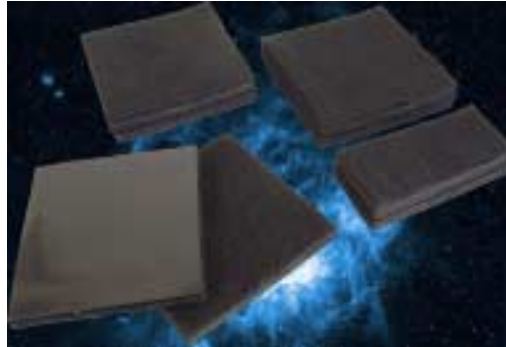

The adhesive backing is based on water-soluble substances and is free of organic solvents. No chemical fire preventers are required as polyester has good fireresistant properties.

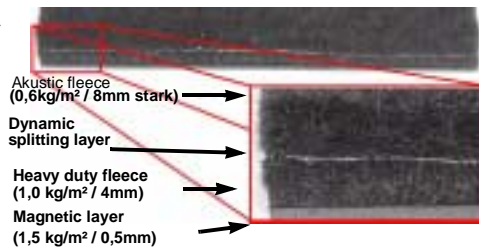

MagicFleece has proven itself for years, and could easily assert itself over the com-

MagicFleece Mag(netic)

The quick tile system without glue

Silencing a computer never was faster or easier - no glue, no cutting and fitting of matting, and 100% reusable! The MagicFleece MAG tile system will hold fast to any iron-containing surface due to its strong magnetic backing.

And when the time is due for the next generation PC - just remove the fleece-tiles from the old computer and click them into the next - it really is a snap!

Due to it's increased density and weight of 3,0 kg/m² MagicFleece MAG provides even better dampening capabilities than the standard issue of MagicFleece.

MagicFleece FE

The Heavyweight-Champion

This version of MagicFleece is fitted with an inlay of iron plates which increase the density/weight of the material to 13 Kg/m². This ensures maximal dampening of vibrations and other chassis or casing transferred and amplified noise.

Manufacture of the MagicFleece FE is quite difficult and slow; hundreds of little iron plates are inserted into the fleece manually.

So, MagicFleece FE certainly is not a low-cost solution - but acoustically, it is the best we can make for you to enjoy.

MagicFleece Lana

The ecological Alternative

Nothing but pure nature: MagicFleece Lana combines the best of the traditional MagicFleece with the extremely low emission profile and environmental gentleness of a fully natural, renewable resource:

Instead of polyester fibres, MagicFleece Lana is made entirely from natural wool. Using the same advanced techniques for the manufacture of the original MagicFleece, the Lana version offers comparable acoustical properties, although it needs to be 12 mm thick same as the polyester version (and same weight 1.6 kg/m²).

Apart from the ecological and health benefits, natural wool (degreased) has excellent fire resistance, so again, as in all MagicFleece versions, no chemicals need to be added.

The natural origin of the material remains visible, as we consciously decided to refrain from any bleaching or dying.
